Criteria route

Orness aggregates the criteria of each asset
= Choquet integral, symmetric capacity
blind to the covariance of returns

Conservative profiles can select riskier assets
Risk-order inversion: ρ = −0.93 (US), −0.86 (CO)

same orness →

Spectral route (PR-WOWA)

Same orness on the ordered portfolio outcomes
= spectral risk measure, coherent for
cautious profiles, LP-solvable, nests CVaR

Risk positively rank-correlated with orness
in 99% (US) and 92% (CO) of out-of-sample windows
